# Login page template reactjs

Login page template react js. React js login page template free.

This simply checks if our fields are non-empty, but can easily do something more complicated. A long login form is used which is further arranged with rounded corners. @media all and (min-width: 480px) { .Login { padding: 60px 0; } .Login form { margin: 0 auto; max-width: 320px; } } These styles roughly target any non-mobile screen sizes. For help and discussion Comments on this chapter Marketplace A marketplace of digital assets... Icons, Illustrations, Patterns, Textures... Display, Script, Sans Serif, Serif... Mock Ups, Social Media, Presentations... Characters, Objects, Textures... WordPress, Shopify, Bootstrap, HTML5... Procreate, Affinity, Photoshop, InDesign... Earn money doing what you love A login page is of outrageous significance to web and application design, particularly for online stores or internet business websites. We are setting the form controls to show the value of our two state variables email and password. Right at the top of our component, we are using the useState hook to store what the user enters in the form. Wanna take a peek at it? Next, let's connect our login form to our AWS Cognito set up. With clear, delightful gradients, the interface offers great meaningfulness. You can add features such as 'Remember Me', 'Forgot Password', and mainly 'Sign Up' to make the design look more professional. An inventive and appealing login page will surely get the client's consideration, direct a high volume of visitors to your website, and increase the customer base. We have more to show regarding this 'React JS Login Form'. If you are transitioning from Class components to using React Hooks, we've added a chapter to help you understand how Hooks work. So let's start by creating the basic form that'll take the user's email (as their username) and password. And include our component in the header. We'll be touching on this further when we create the signup form. We also link up our submit button with our state by using a validate function called validateForm. It likewise vanishes on hover. Responsive Login Form in React JS Live Preview See the Pen Responsive React Login Form by Rares Lungescu (@rares-lungescu) on CodePen. Once we set the new state, our component gets re-rendered. Its provided to your right beneath. So without any further ado, let us now have a brief discussion on a responsive login form design made with HTML, CSS, and React JS. There is a lot of space for improvements. Below you have two input fields to address your Username and Password. At the top, you have the space to add your brand name or your company logo. A spotless and new popup login page that you can use for your website. About This DesignAuthor: Rares LungescuDemo/Source CodeMade with: HTML/CSS/JS(Babel)Responsive: Yes Related Finally, we trigger our callback handleSubmit when the form is submitted. For now we are simply suppressing the browser's default behavior on submit but we'll do more here later. Placeholders are also organized wonderfully which acts as a hint to describe what needs to be entered. No worries, as the source code is fully accessible and is

free to use, thus, you can make full use of it and tweak around the codes. Add the Container Create a new file src/containers/Login.js and add the following. In case you are willing to be straightforward and want to follow the modern way, you can login through the social profiles at the base. The variables email and password now have the new values. When we created our User Pool we asked it to allow a user to sign in and sign up with their email as their username. import Login from "/containers/Login"; Now if we switch to our browser and navigate to the login page we should see our newly created form. We are setting the autoFocus flag for our email field, so that when our form loads, it sets focus to this field. The useState hook just gives you the current value of the variable you want to store in the state and a function to set the new value. It is denoted as a 'Submit' button which helps you to proceed in after you are all set. The manner in which the colors play along likewise adds essentialness to the interface. Let's add a couple of styles to this in the file src/containers/Login.css. Add the Route Now we link this container up with the rest of our app by adding the following line to src/Routes.js below our home . In React, this pattern of displaying the current form value as a state variable and setting the new one when a user types something, is called a Controlled Component. import React, { useState } from "react"; import Form from "react-bootstrap/Form"; import Button from "react-bootstrap/Button"; import "/Login.css"; export default function Login() { const [email, setEmail] = useState(""); const [password, setPassword] = useState(""); function validateForm() { return email.length > 0 && password.length > 0; } function handleSubmit(event) { event.preventDefault(); return ( Email setEmail(e.target.value) /> Password setPassword(e.target.value) /> Login ); } We are introducing a couple of new concepts in this. Down below is another button which fills with a gradient shade. We then connect the state to our two fields in the form using the setEmail and setPassword functions to store what the user types in — e.target.value. Let's create a page where the users of our app can login with their credentials.
